

# How to make an Camera Obscura

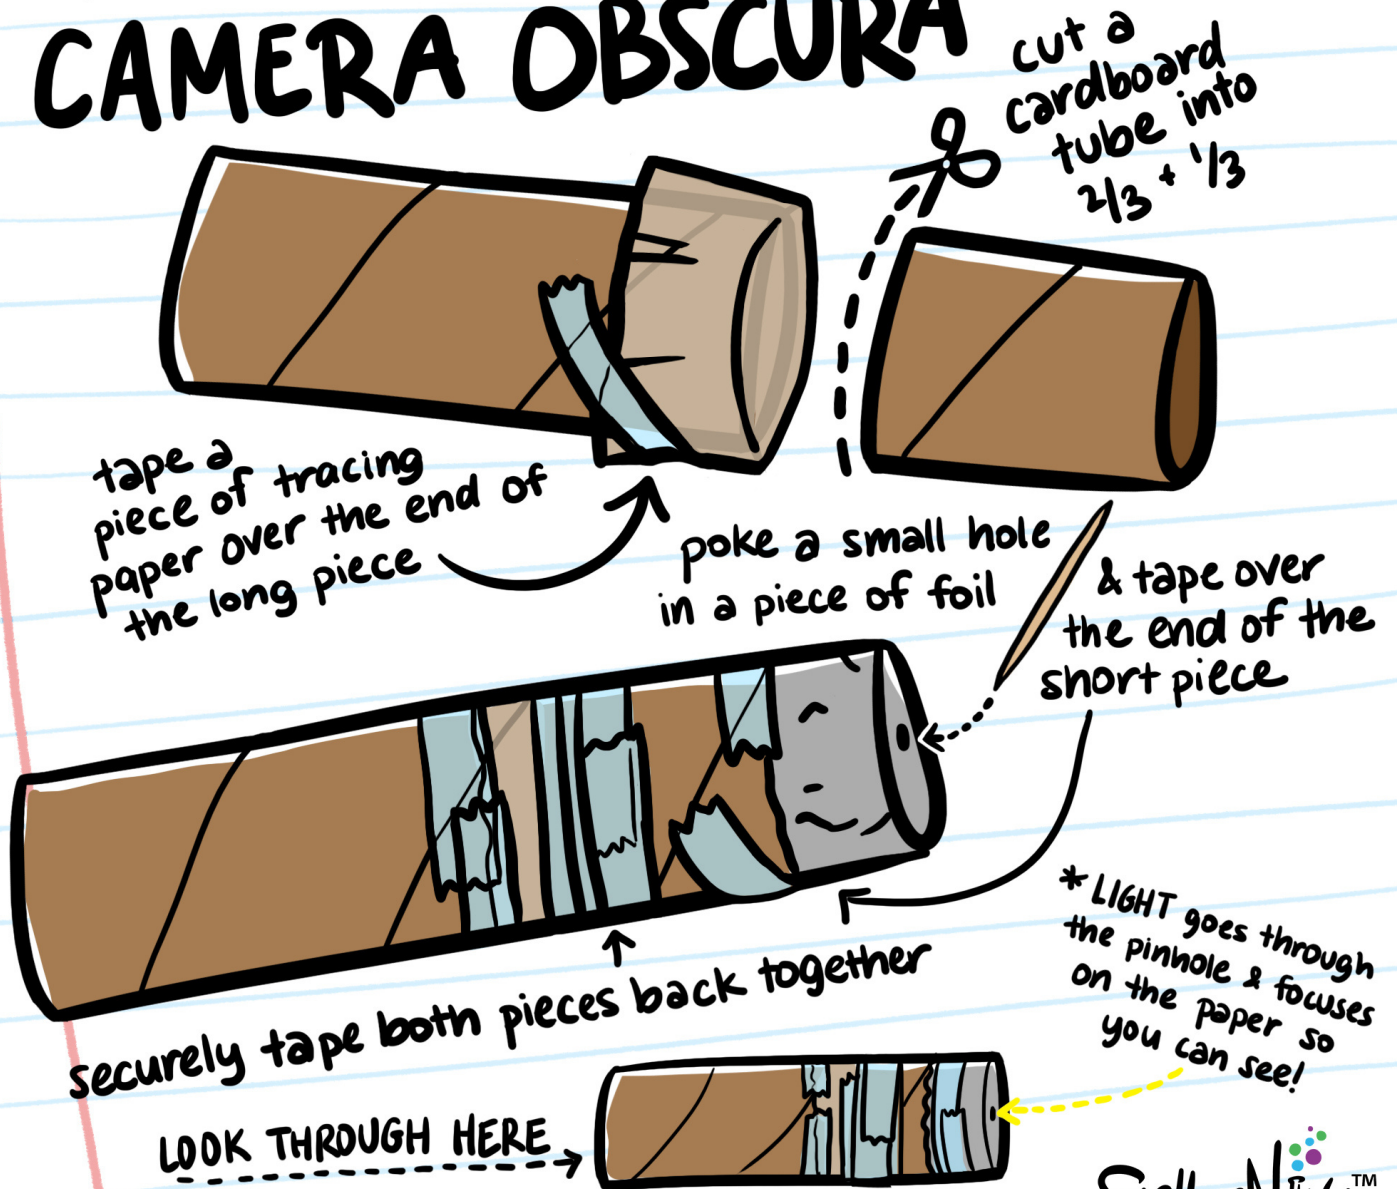

## IMA At Home

A camera obscura is a darkened device. It has a small hole or lens at one side. Images are projected through the mirror on to a wall or other object.

Camera obscura is one of the oldest cameras. In Latin, it means “dark chamber,” and the earliest versions, had small darkened rooms with light projected through a single small hole. The inverted image of the outside scene is cast on the opposite wall, which is usually white in colour.
